
Presbyopia-correcting IOLs

Some IOLs provide clear vision at more than one distance, making you less dependent on glasses or contacts. These types of IOLs are called **multifocal**, **accommodative**, and **extended depth-of-focus** lenses. They can help people frustrated with presbyopia, the loss of focusing power that normally comes with age.

Presbyopia-correcting lenses may allow you to see clearly both near and far.

Multifocal lenses

The surface of a **multifocal lens** is divided into specific zones. Each zone focuses light rays differently. Both near and far vision can be clear, depending upon the part of the lens you look through.
