Corneal Transplants

What to expect when you have a corneal transplant

Days or weeks before your transplant. Your ophthalmologist will talk with you about corneal transplant surgery. You will discuss why you need this surgery, how it can help you see better, and what you can expect during and after surgery.

Once you decide to have a corneal transplant, a date will be scheduled for surgery. That date may change if a good donor cornea is not ready for you at that time.

Tell your ophthalmologist about all the medicines you take, or she will tell you if you can keep taking them before surgery. You may need to stop using blood thinners before surgery.

You may need to visit your primary care doctor for a physical exam and perhaps other tests. This is to make sure you are healthy enough to have the transplant surgery.

You should make sure you will not be able to drive after the transplant surgery.

You will not be able to drive after the transplant surgery. You should make arrangements for someone to drive you home after surgery.

The day of your transplant. A cornea transplant is done as an outpatient procedure.

Your eye surgeon will have chosen how to transplant the healthy donor cornea based on your specific need.

In some cases, he or she may remove a circular part of your cornea and replace it with a matching portion of the donor cornea, stitching it into place.

Sometimes he or she will remove only a very thin layer of cells from the front of the cornea, replacing them with donor tissue and stitching it into place.

In other cases, only the damaged inner layer of the cornea is removed and a thin disc of healthy donor tissue is placed on the back surface of the cornea. An air bubble is then put in the eye to push this new cell layer into place.

Depending on the type of transplant you had and how your eye heals, it can take a year or more to fully recover from this surgery.

Possible problems with corneal transplant

One reaction is when the body's immune system rejects the transplanted tissue as something that doesn't belong and tries to get rid of it. For full-thickness transplant, rejection can happen to 1 in 10 to 12 people. With a partial thickness transplant, the risk of rejection is lower.

Depending on the type of transplant you had and how your eye heals, it can take a year or more to fully recover from this surgery.

Warning signs of your body trying to reject your corneal transplant:

- eye pain
- being extra sensitive to light
- redness of the eye
- cloudy or hazy vision

Tell your ophthalmologist right away if you have any of these signs. He or she might be able to stop the rejection with medicine.

Sometimes corneal transplant can cause other eye problems such as:

- infection
- bleeding
- detached retina (where the tissue lining the back of the eye pulls away from the eye)
- glaucoma (through increased pressure inside the eye)

Even when corneal transplants work as they should, other eye problems could limit your vision such as:

- uncorrected nearsightedness
- myopia
- astigmatism
- corneal thinning may be needed.

Warning signs of your body trying to reject your corneal transplant:

- eye pain
- being extra sensitive to light
- redness of the eye
- cloudy or hazy vision

- glaucoma (through increased pressure inside the eye)

An opportunity for clear vision

If you have a damaged cornea, you and your ophthalmologist will discuss your options for improving your vision. For people with a deeply scarred or swollen cornea, transplant surgery can restore clear vision.

Summary

Corneal transplant is surgery that replaces a damaged or damaged cornea with a healthy donor cornea.

There are different types of corneal transplants. Sometimes one or more layers of the corneas are replaced with new tissue. Sometimes, the entire cornea may be replaced. Recovering clear vision may take up to a year or more after surgery.

There is a chance that the transplanted cornea might be rejected by the body. Sometimes another corneal transplant may be needed.

If you have any questions about your eyes or vision, speak with your ophthalmologist. He or she is committed to protecting your sight.
Your cornea must be clear, smooth and healthy for good vision. If it is scarred, swollen, or damaged, light is not focused properly into the eye. As a result, your vision is blurry or you see glare.

What causes cornea problems?

Eye disease and injuries can damage the cornea. Here are some common eye problems that can lead to a damaged cornea:

- Keratoconus, where the cornea is cone-shaped rather than dome-shaped
- Punctal dystrophy, where cells in the inner layer of the cornea are not working effectively
- Eye infections or injuries that scar the cornea
- Previous corneal surgery or other eye surgery that damaged the cornea

Corneal transplants

If your cornea cannot be healed or repaired, your ophthalmologist may recommend a corneal transplant. This is when the diseased cornea is replaced with a clear, healthy cornea from a human donor.

A human donor is someone who chooses to donate (give) his or her cornea after their death to people who need them. All donated corneas are carefully tested to make sure they are healthy and safe to use. There are different types of corneal transplants. In some cases, only the front and middle layers of the cornea are replaced. In others, only the inner layer is removed. Sometimes, the entire cornea needs to be replaced.

Full thickness corneal transplant

Your entire cornea may need to be replaced if both the front and inner corneal layers are damaged. This is called penetrating keratoplasty (PK), or full thickness corneal transplant. Your diseased or damaged cornea is removed. Then the clear donor cornea is sewn into place.

PK has a longer recovery period than other types of corneal transplants. Getting complete vision back after PK may take up to 1 year or longer.

With PK, there is a slightly higher risk than with other types of corneal transplants that the cornea will be rejected. This is when the body’s immune system attacks the new cornea tissue.

Partial thickness corneal transplant

Sometimes the front and inner layers of the cornea are damaged. In this case, only those layers are removed. The endothelial layer, or the back skin layer, is kept in place. This transplant is called a deep anterior lamellar keratoplasty (DALK) or partial thickness keratoplasty. SBA is a subtype used to treat keratoconus or edging of the cornea.

Healing time after DALK is shorter than after a full corneal transplant. There is also less risk of having the new cornea rejected.

Endothelial keratoplasty

In some eye conditions, the innermost layer of the cornea called the "endothelium" is damaged. This causes the cornea to swell, affecting your vision. Endothelial keratoplasty is a surgery to replace this layer of the cornea with healthy donor tissue. It is known as a partial transplant because only this inner layer of tissue is replaced. There are a few types of endothelial transplants:

- DSEK (or DSALK)—Descemet’s Stripping (Automated) Endothelial Keratoplasty
- DMEK—Descemet’s Membrane Endothelial Keratoplasty

Each type removes damaged cells from an inner layer of the cornea called Descemet’s membrane. The damaged corneal layer is removed through a small incision. Then the new tissue is put in place. Just a few stitches—if any—are needed to close the incision. Much of the cornea is left untouched. This lowers the risk of having the new cornea cells being rejected after surgery.

Some things to know:

- With DSEK/DSEK surgery, the donor tissue may be easier to transplant and position because it is thicker than the donor tissue in DMEK surgery.
- In DMEK surgery, the donor tissue is thicker and may be more difficult to transplant. But recovery is quicker because the transplant tissue is thinner.
- Your eye surgeon will choose the type of surgery based on your cornea's condition.

The American Academy of Ophthalmology is the world’s largest association of eye physicians and surgeons. A global community of 32,000 medical doctors, we protect sight and empower lives by setting the standards for ophthalmic education and advocating for our patients and the public.
